

# Water stable isotopes during AMMA: what information about land surface processes?

Camille Risi, Sandrine Bony, Françoise Vimeux, Luc Descroix

LMD

11 Décembre 2008

# Water stable isotopes

- ▶ water = light ( $H_2^{16}O$ ) + heavy ( $H_2^{18}O$ ,  $HDO$ ) molecules
- ▶ isotopic fractionation
- ▶ applications: past climate, present water cycle, land surface-atmosphere interactions

# Goals and measurements during AMMA

## ▶ Goals

- ▶ what controls the isotopic composition of tropical water?
- ▶ what information from isotopes about water cycle, convection, land surface processes?
- ▶ potential to better constrain their representation in climate models?

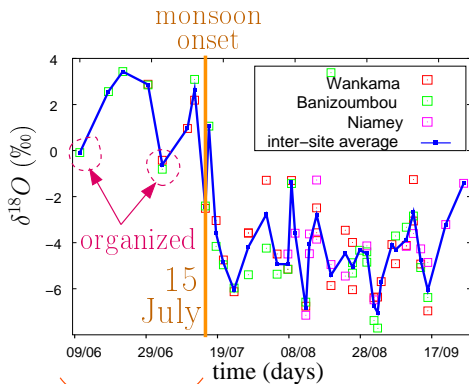

## ▶ Isotopic measurements in rain during AMMA

- ▶ rain sampled at event scale during the 2006 season in Niamey, Wankama et Banizoumbou (*Risi et al, GRL, 2008*)
- ▶  $\delta^{18}O$  = enrichment in  $H_2^{18}O$  in ‰ relatively to a standard

# $\delta^{18}O$ evolution during the 2006 season

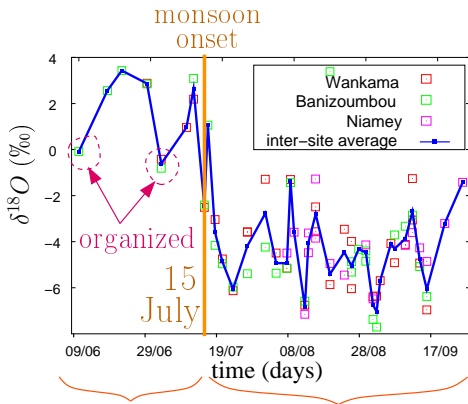

# $\delta^{18}O$ evolution during the 2006 season

intensity and  
organisation  
of individual  
systems

# $\delta^{18}O$ evolution during the 2006 season

intensity and  
organisation  
of individual  
systems

# $\delta^{18}O$ evolution during the 2006 season

intensity and  
organisation  
of individual  
systems

temporal integration  
of convection  
record of intra-seasonal  
variability

# Questions

- ▶ what processes behind the **temporal integration** of convection?
  - ▶ role of soil water?
  - ▶ information about residence time?
- ▶ interprétation of **d-excess** data? land surface processes?

$$d\text{-excess} = \delta D - 8 \cdot \delta^{18} O$$

# Why land surface processes impact isotopes?

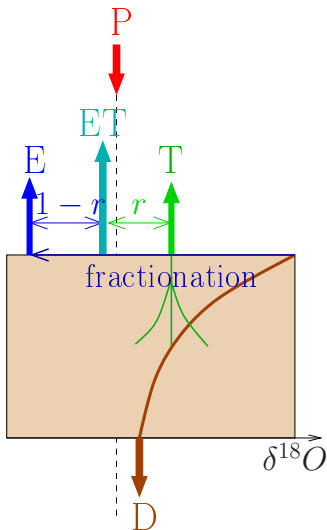

- ▶ proportion transpiration / bare soil evaporation
- ▶ proportion evapotranspiration / surface runoff / drainage

(e.g. Gat 2000,  
Henderson-Sellers et al 2001)

# Sensitivity tests with ORCHIDEE-iso offline on a site

- ▶ Strong sensitivity to:
  - ▶ soil isotopic profiles, soil water **vertical diffusion**
  - ▶ rain **infiltration**
  - ▶ partition recycling / surface runoff / drainage
  - ▶ partition evaporation / transpiration
- ▶ potential to **better constrain land surface processes representation** in models?

# Study with LMDZ-ORCHIDEE zoomed on the AMMA region

- ▶ Isotopes implemented in:
  - ▶ **LMDZ** (no fractionation at land surface), global evaluation
  - ▶ **ORCHIDEE offline**, site evaluation
- ▶ in progress:
  - ▶ **LMDZ-ORCHIDEE** coupled simulations
  - ▶ global evaluation with isotopic data in precip, vapor, soil, rivers, biosphere
- ▶ in project: **zoomed nudged** simulations on AMMA region
  - ▶ interpretation of AMMA isotopic data
  - ▶ sensitivity tests
    - ▶ what information about land surface recycling, processes?
